

BONG STUDY HUB · FOUNDATION BATCH 2026 · CLASS 05

Your First Python Program

From English Instructions → Python Code

THE BIG QUESTION

**If a computer only does exactly
what it's told, how do we tell it
something it can actually follow?**

One Box We Never Opened

Four classes. Never once did we write a real program.

What Is a Programming Language?

**A LANGUAGE WITH STRICT,
PRECISE RULES —
ZERO GUESSING ALLOWED.**

Precision, Side by Side

IN ENGLISH

“Go on, print Hello World for me.”

A person fills in every gap automatically - which words, what tone, even whether you're serious.

=

IN PYTHON

`print("Hello, World!")`

One exact form. Nothing left for the computer to guess.

THE TOOL WE'RE USING

Meet Python

PYTHON

**A PROGRAMMING LANGUAGE,
DESIGNED TO BE READABLE**

ONE OF MANY — NOT “THE” PROGRAMMING LANGUAGE

Where Code Runs

- EDITOR — you type here

```
print("Hello, World!")
```

OUTPUT — you see results here

Hello, World!

Editor: where you type. Output: where you see what happened. That's the whole mental model for today.

Your First Line

- `print("Hello, World!")`

Type this exact line yourself before we run it. What do you think will happen?

PRESS RUN

Running the Program

- `print("Hello, World!")`

OUTPUT

Hello, World!

Strings Need Quotes

- `print(Hello, World!)`

ERROR

NameError: name 'Hello' is not defined

Multiple Instructions, In Order

- ```
print("Hello, my name is Priya.")

print("I am learning Python.")

print("This is my very first program!")
```

## OUTPUT

```
Hello, my name is Priya.
I am learning Python.
This is my very first program!
```

PREDICT BEFORE YOU RUN

**What happens to the output  
if I swap lines 1 and 3?**

*Try it live if time allows - the output order swaps too.*

# Comments

```
This program introduces me
```

```
print("Hello, my name is Priya.") # prints my name
```

```
print("I am learning Python.")
```

**OUTPUT — unchanged by the comments**

Hello, my name is Priya.

I am learning Python.

# When Syntax Breaks: Two Errors

```
print("Hello, World!")
```

```
Print("Hello, World!")
```

## MISSING QUOTE

SyntaxError: unterminated  
string literal

## WRONG CAPITALIZATION

NameError: name 'Print'  
is not defined

# Errors Are Normal

---

**AN ERROR IS NOT  
A JUDGMENT ON YOU.  
IT'S PYTHON TELLING YOU  
EXACTLY WHERE IT GOT CONFUSED.**

# The Write–Run–Read–Fix Loop

---

*...then run again. Nobody writes a perfect program on the first try - this loop is the normal way it works.*

## THE HERO DIAGRAM

*Cyan = new today · Card = already known from Class 01*

# My First Program: About Me

At least three `print()` lines.

At least one comment (`#`).

*Write it, run it, then break it on purpose - remove a quote, or misspell print - and read the error together.*

# About Me — Template

---

# About Me

```
print("Hello, my name is ____.")
```

```
print("I am learning Python for the first time.")
```

```
print("My favorite ____ is ____.")
```

REFLECT

**Did the computer do anything  
you didn't tell it to?**

# Quick Recap

---

## A QUESTION FOR NEXT TIME

**Right now, every piece of text  
in your programs is fixed. What if  
a program needed to remember  
something that changes?**

#### FINAL TAKEAWAY

---

**“You didn't just learn about programming today — you did it. Every program you will ever write is built from exactly this: precise instructions, run in order, read carefully when they go wrong.”**
